Decision record

Direction recorded

Monitoring remains the primary deliverable; stimulation is exploratory. The October 27 stakeholder meetings raised comfort, feasibility and preservation of hand function as reasons to evaluate stimulation separately.

No sensing platform has been chosen. Wrist measurements are the current requirements baseline; selecting another location will require revised inputs.

Selection method

Screen candidate devices and data sources for usable motion data. Compare feasible choices by data quality, comfort and practicality, setup, cost and development effort.

The comparison and selection are not complete. The proposed demonstration may use simulation or suitable recordings, depending on the chosen route.

Supervisor response

November 10: Dr. Leung allowed resubmission by November 13 and asked for all TA comments to be addressed.
