Meeting with Dr Spencer Smith

21 September 2026 at 1:34 p.m.

Main discussion

We introduced a wrist device to measure and reduce tremor, with motors and electrical stimulation raised as possible approaches.

Dr Smith asked what existing devices showed was feasible, what hardware experience we had, and how we would test the idea.

He suggested adding data collection over time, analysis and a user interface so there would be a useful software deliverable even if suppression proved difficult. We agreed to expand the proposal.

We discussed simulation as a possible fallback. Separating tremor from intended movement, including typing, was still an open problem.

Mohamad suggested looking at both technical performance and patient satisfaction.

Dr Smith asked us to track costs, compare existing products and send a briefing before future meetings.

Next steps

Add data collection, analysis and a user interface to the proposal.

Send Dr Smith and Mohamad links to relevant devices and previous projects.

Get biomedical feedback and ask stakeholders what recorded information would be useful.

Develop a fallback and track prototype and competitor costs.

Still open

The actuator, algorithm, test method and performance targets were undecided.

Dr Smith supported the expanded software scope. Biomedical feasibility still needed separate review.
