Meeting with Dr Vincent Leung

30 October 2026 at 10:59 a.m.

Main discussion

We updated Dr Leung on the stakeholder meetings, existing products and proposed sensing and stimulation system.

We proposed focusing on tremor while grasping or holding an object, with a monitor-only option alongside treatment. We asked whether the revised scope was manageable.

Fouzan summarized the stakeholder feedback. We discussed Cala and Felix products and the importance of reliable sensing, comfort and useful hand function.

Mazen outlined the wristband, sensors, signal processing, stimulation hardware and app.

Dr Leung repeatedly asked what we would actually demonstrate in December. We proposed motion monitoring and preliminary stimulation work, but the equipment and setup were still unresolved.

We discussed induced tremor-like movement as an exploratory test idea and planned to ask the 4F lab coordinator about equipment. No testing protocol was approved in the meeting.

We explained that the early C code had only been tried on computer-generated signals. A PhysioNet dataset had been identified but had not yet been run through the code.

Dr Leung said there was about a month left and encouraged us to focus on getting the proof of concept working. He said the stakeholder contacts were good progress.

Next steps

Define exactly what the December demonstration will show.

Contact the lab coordinator about equipment.

Develop the sensing and analysis proof of concept and move beyond the initial clean-signal checks.

Still open

The prototype configuration, equipment access, test method and task owners were not finalized.
