First Graded Meeting Agenda

IBEHS 5P06 Capstone

Friday, October 30, 2026 | 11:00-11:30 AM | Microsoft Teams

Instructor: Dr. Vincent Leung

Review research and stakeholder feedback for a proposed wrist-worn device for Parkinson's hand-tremor reduction and monitoring and agree on the product scope and next development steps.

Product scope and intended users

Our current proposal combines sensory electrical stimulation with movement monitoring, with a monitoring-only version using the same sensing system. We would like feedback on initially targeting postural/action hand tremor affecting an everyday task, and how this relates to the direction described in Progress Report 2.

Stakeholder feedback and design implications

Summarize our October 27 discussions with Dr. Dave Collins (University of Alberta) and Dr. Martin McKeown (University of British Columbia). Discuss their advice on wrist and hand function, voluntary movement, comfort and variable treatment response, and how it changes our design priorities.

Existing devices and product requirements

Review the FDA and competitor findings, particularly Cala's Parkinson's action-tremor indication. Discuss which improvement we should prioritize, such as easier setup, comfort or affordability, and what user evidence and measurable requirements would justify it.

Proposed design and development plan

Discuss our proposed approach to measuring hand tremor, delivering sensory electrical stimulation and making the device comfortable to wear. Ask which parts we should develop first and what evidence or testing would be needed to evaluate the concept.

Next deliverables and supervisor feedback

Agree on achievable deliverables before our next meeting, along with required equipment, budget, team responsibilities and dates. Use this feedback to update the DHF and Gantt chart.

For review: Progress Report 2, the October 27 stakeholder summary and FDA/Cala research notes.

Team members: Fouzan Pasha, Mazen Hussain, Imran Chowdhury and Michael Padeigis.
