Tremor & Essential Tremor

Clinical Overviews

Essential Tremor

Essential tremor (ET) is the most common tremor syndrome seen in adults. Essential tremor is an isolated tremor syndrome of bilateral upper limb action tremor with at least 3 years' duration, as recently defined by the MDS Task Force for Tremor. Tremor in other locations (e.g., head, voice, or lower limbs) may (or may not) be present. But there are no other neurological signs, such as dystonia, ataxia, or parkinsonism. To further clarify and to delineate ET from other tremors, exclusion criteria were also formulated: Thus, isolated focal tremors (voice, head), orthostatic tremor with a frequency >12 Hz, task- and position-specific tremors and sudden onset and step-wise deterioration do not fall into the category of ET.
